

**How do I know if my patients  
are sick with obesity?**

Using the AAP algorithm to guide assessment  
and management of patients with overweight  
and obesity.

MAAP 2017 Spring Conference  
Dr. Tory Rogers  
Dr. Mike Dedekian

*Let's Go! is a program of The Barbara Bush Children's Hospital At Maine Medical Center*

### Disclosure Statement

Victoria W. Rogers, MD, FAAP

- I have no relevant financial relationships with the manufacturer(s) of any commercial products(s) and/or provider of commercial services discussed in this CME activity.
- I do not intend to discuss an unapproved/investigative use of a commercial product/device in my presentation.

3

---

---

---

---

---

---

---

---

### Disclosure Statement

Michael Dedekian, MD, FAAP

- I have no relevant financial relationships with the manufacturer(s) of any commercial products(s) and/or provider of commercial services discussed in this CME activity.
- I do not intend to discuss an unapproved/investigative use of a commercial product/device in my presentation.

---

---

---

---

---

---

---

---

## Why a new Algorithm?

- Children with overweight and obesity may be sick
- PCPs need to screen for comorbidities
- To the extent possible, patients should be cared for in their medical home
- Providers have asked for guidance

4

---

---

---

---

---

---

---

### How did we develop the algorithm?

- Engaged a small group of experts
- Relied on existing guidelines
- Utilized new research and new consensus statements

5

---

---

---

---

---

---

---

## Take Home Messages

- Assessment is a critical piece of the puzzle
- This assessment is doable in the primary care setting
- Children who have a BMI  $\geq 85\%$  may be sick and may need:
  - Special consideration to determine if they are ill
  - Laboratory tests
  - Additional work-up for comorbidities as determined by positive signs and symptoms and family history

6

---

---

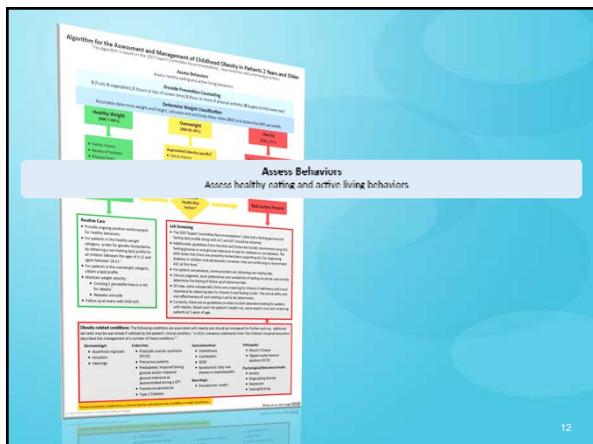

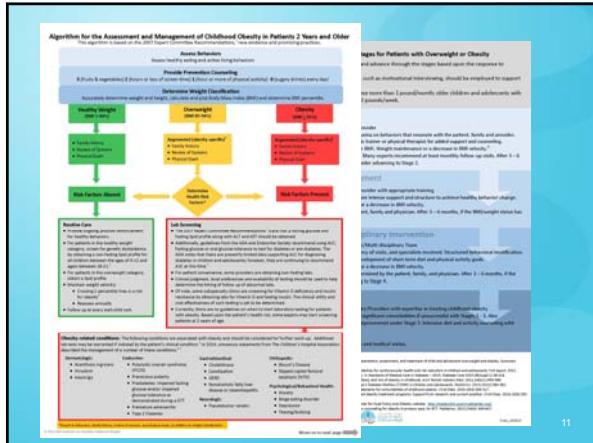

---

---

---

---

---

## Healthy Habits Questionnaire

Gets conversation started between parent and child  
 Keeps conversation going throughout appointment  
 Can be used as a HEDIS measure

**5210 Healthy Habits Questionnaire ages 2-5**

We are interested in how well you do with your child's healthy habits. Please answer the questions below.

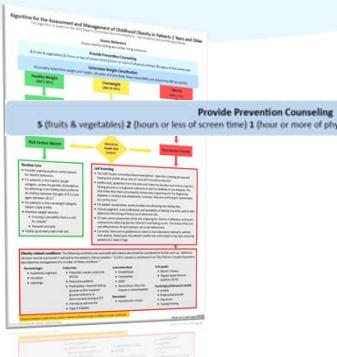

**LET'S GO!**

1. How many times a week do you respond to your child's healthy habit questions? \_\_\_\_\_  
 2. How many times a week do you eat together with your child? \_\_\_\_\_  
 3. How many times a week do you exercise with your child? \_\_\_\_\_  
 4. How many times a week does your child sleep better than the night before? \_\_\_\_\_  
 5. How much screen time do you have with your child? \_\_\_\_\_  
 6. How many times a week do you exercise outside? \_\_\_\_\_  
 7. How much time do you eat while driving? \_\_\_\_\_  
 8. How many times a week do you sleep less than 8 hours? \_\_\_\_\_  
 9. How many times a week do you eat while watching TV? \_\_\_\_\_  
 10. How many times a week do you eat while reading a book? \_\_\_\_\_  
 11. How many times a week do you eat while talking on the phone? \_\_\_\_\_  
 12. How many times a week do you eat while working? \_\_\_\_\_  
 13. How many times a week do you eat while driving? \_\_\_\_\_  
 14. How many times a week do you eat while reading a book? \_\_\_\_\_  
 15. How many times a week do you eat while talking on the phone? \_\_\_\_\_  
 16. How many times a week do you eat while working? \_\_\_\_\_

thank you!

9

## Provide prevention counseling

10

---

---

---

---

---

---

---

---

---

20

---

---

---

---

---

---

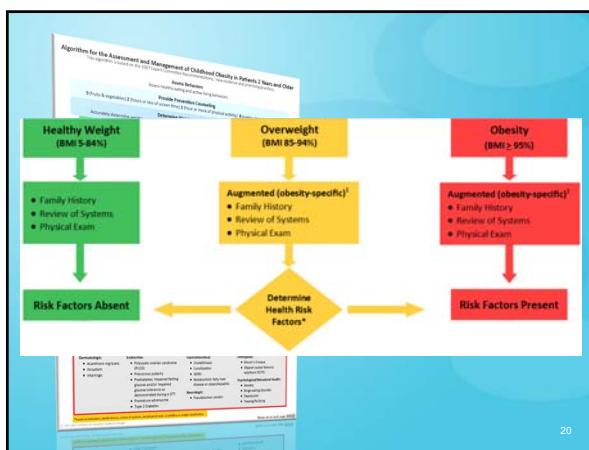

---

---

---

---

**Expectations in Primary Care: Growth**

- Accurately measure and chart growth
  - Birth to 23 months – weight-for-length
  - 2 years and older – weight, height, BMI, BMI% and weight classification
- Identify and note concerns

13

---

---

---

---

---

---

---

---

“ ”

**Words**

What words do you use when referring to the patient's BMI?

- Be sensitive and direct
- Share why you, as the provider, care
- Avoid colloquialisms
- Use the “O” word carefully

Childhood Obesity in Primary Care

---

**You Are Here**

**Algorithm for the Assessment and Management of Childhood Obesity in Patients 2 Years and Older**

**Assess Behaviors**

**Provide Information Counseling**

**Determine Weight Classification**

**Provide Prevention Counseling**

**Accurately determine weight and height, estimate and plan Body Mass Index (BMI) and determine BMI percentile**

**Identify related conditions**

**Provide Referrals**

Source: Breaking obesity—into living behaviors

Provide Prevention Counseling

• (fruits & vegetables)  $\leq$  (hours or less of screen time)  $\geq$  (hour or more of physical activity)  $\leq$  (sugary drink) every day!

Determine Weight Classification

• Accurately determine weight and height, estimate and plan Body Mass Index (BMI) and determine BMI percentile

Identify related conditions

• Anemia

• Asthma

• Celiac disease

• Constipation

• Diarrhea

• Endocrinopathies

• Gastroesophageal reflux disease

• Headache

• Hypertension

• Impaired glucose tolerance

• Insulin resistance

• Metabolic syndrome

• Osteoporosis

• Orthopedic problems

• Sleep apnea

• Tendonitis

Childhood Obesity in Primary Care

15

---

---

---

---

---

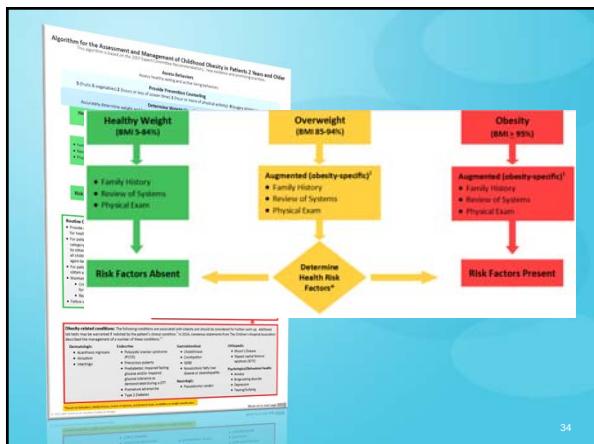

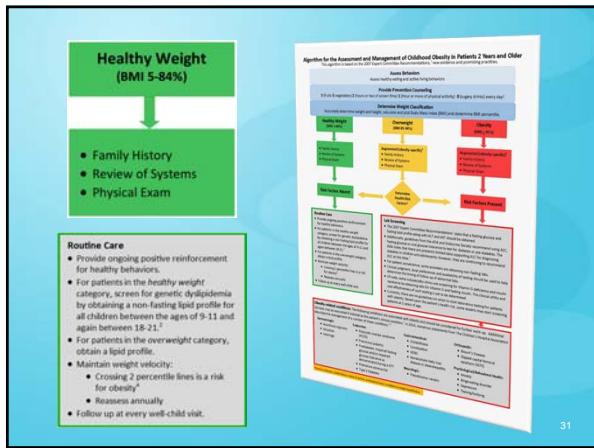

---

---

---

### Pausing for a Moment

- These kids could be sick
- Children at greater than 85<sup>th</sup> percentile are at a higher risk for comorbidities
- We are going to look at 3 ways to fine-tune/augment your assessment:
  - Family History
  - Review of Systems
  - Physical Exam

Childhood Obesity in Primary Care

## Augmented Obesity-specific Family History

- Obesity
- Type 2 Diabetes
- Hypertension
- Lipid level abnormalities
- Heart disease

Barlow S. Expert Committee. Expert committee recommendations regarding prevention, assessment, and treatment of child and adolescent overweight and obesity: Summary report. Pediatrics. 2007;120(4):S164-S192.

19

---

---

---

---

---

---

---

---

---

---

## Augmented Obesity-specific Review of Systems

Symptoms	Probable causes
Snoring/sleep disturbances	Obstructive sleep apnea
Abdominal pain	GERD, constipation, gall bladder disease, NAFLD
Menstrual irregularities	Polycystic ovary syndrome/Prader-Willi syndrome
Hip, Knee, Leg pain	SCFE
Foot Pain	Musculoskeletal stress from weight
Polyuria/Polydipsia	Type 2 DM
Anxiety, school avoidance, social isolation	Depression
Severe recurrent headaches	Pseudotumor cerebri
Shortness of breath	Asthma

Barlow S. Expert Committee. Expert committee recommendations regarding prevention, assessment, and treatment of child and adolescent overweight and obesity: Summary report. Pediatrics. 2007;120(4):S164-S192.

20

---

---

---

---

---

---

---

---

---

---

## Augmented Obesity-specific Physical Exam

Findings	Possible Explanations
Elevated Blood Pressure (correct cuff)	Hypertension on 3 or more occasions
Short Stature	Underlying endocrine conditions
Acanthosis nigricans	Increased risk of insulin resistance
Acne, Hirsutism	Polycystic ovary syndrome
Skin irritation, inflammation	Intertrigo
Papilledema, cranial nerve VI paralysis	Pseudotumor cerebri
Tonsillar hypertrophy	Obstructive sleep apnea
Gait	Hypothyroidism
Wheezing	Asthma
Tender Abdomen	GERD, gallbladder disease, NAFLD
Abnormal gait, limited hip range	SCFE
Bowing of tibia	Blount disease
Small hands and feet, polydactyly	Some genetic syndromes
Reproductive (Tanner stage, apparent micropenis, undescended testes)	Premature puberty, may be normal penis buried in fat, Prader-Willi syndrome

Barlow S. Expert Committee. Expert committee recommendations regarding prevention, assessment, and treatment of child and adolescent overweight and obesity: Summary report. Pediatrics. 2007;120(4):S164-S192.

21

---

---

---

---

---

---

---

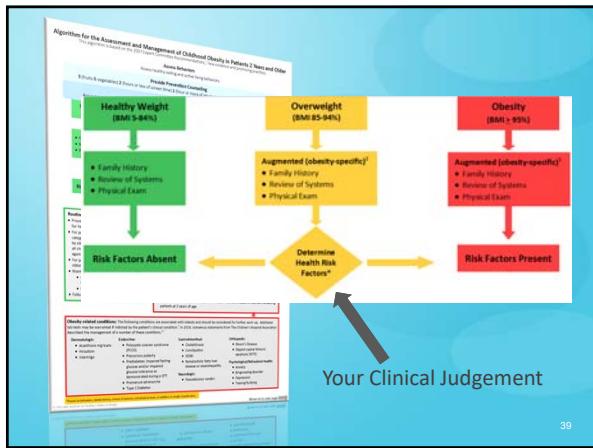

---

---

---

---

---

---

---

---

---

---

---

---

---

## Health Risk Factors: Overweight

- Healthy eating and active living behaviors
- Family history
- Review of systems
- Physical exam

23

---

---

---

---

---

---

---

---

---

---

## Overweight: Absent risk factors

This section focuses on the "Overweight" category (BMI 85-94%) with "Absent risk factors". It follows the same general structure as the main algorithm, starting with assessment steps (Family History, Review of Systems, Physical Exam) leading to the "Determine Health Risk Factors" diamond. The "Risk Factors Absent" path leads to "Routine Care" recommendations. A callout box titled "Your Clinical Judgement" points to the "Risk Factors Present" path. The "Obesity-related conditions" section is also present.

24

---

---

---

---

---

---

---

---

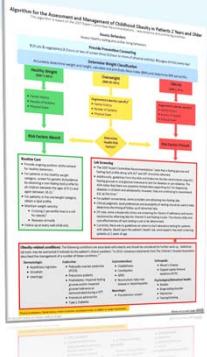

---

---

**Overweight: Risk factors present**

**These children have increased risk for obesity related conditions and need to move to the right side of the algorithm**

25

---

---

---

---

---

---

---

---

**Obesity** ( $BMI \geq 95\%$ )

**Augmented (obesity-specific)<sup>1</sup>**

- Family History
- Review of Systems
- Physical Exam

43

---

---

---

---

---

---

---

---

**Lab Screening**

- The 2007 Expert Committee Recommendations<sup>2</sup> state that a fasting glucose and fasting lipid profile along with ALT and AST should be obtained.
- Additionally, guidelines from the ADA and Endocrine Society recommend using A1C, fasting glucose or oral glucose tolerance to test for diabetes or pre-diabetes. The ADA notes that there are presently limited data supporting A1C for diagnosing diabetes in children and adolescents; however, they are continuing to recommend A1C at this time.<sup>3</sup>
- For patient convenience, some providers are obtaining non-fasting labs.
- Clinical judgment, local preferences and availability of testing should be used to help determine the timing of follow up of abnormal labs.
- Or rather than using screening to screen for Vitamin D deficiency and insulin resistance by obtaining labs for Vitamin D and fasting insulin, the clinical utility and cost effectiveness of such testing is yet to be determined.
- Currently, there are no guidelines on when to start laboratory testing for patients with obesity. Based upon the patient's health risk, some experts may start screening patients at 2 years of age.

44

---

---

---

---

---

---

---

---

## Laboratory Summary Slide

The recommended tests:

- Fasting Glucose
- Fasting Lipid Panel
- ALT
- AST

Additional laboratory test should be obtained as indicated

28

---

---

---

---

---

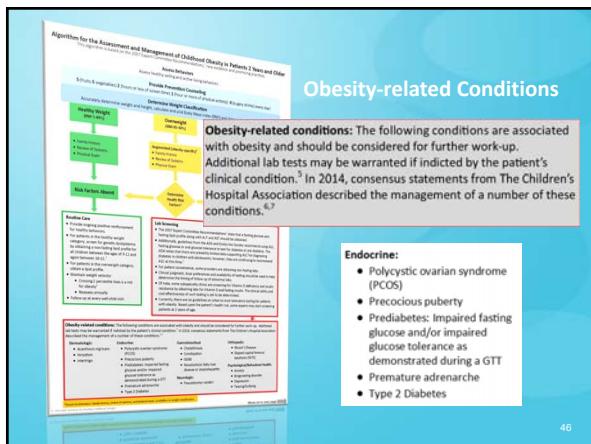

---

---

---

---

48

49

## Management and Treatment

**Key Points:**

- Not every patient is ready
- Fear tactics don't work
- There are no quick fixes
- Frequent visits over time work
- Small behavior changes can have profound effects
- Motivational Interviewing works
- The stages are a guide
- The Next Steps guide and approach can be useful

**Algorithm for the Assessment and Management of Childhood Obesity**

The algorithm consists of four main stages:

- Assess Behaviors**: Assessing behavior and risk factors for childhood obesity.
- Stage 1 Prevention Plus**: Where/By Whom: Primary Care Office/Primary Care Provider. What: Planned follow-up themed visits (15-20 min) focusing on behaviors that resonate with the patient, family and provider. Consider partnering with dietician, social worker, athletic trainer or physical therapist for added support and counseling. Goals: Positive behavior change regardless of change in BMI. Weight maintenance or a decrease in BMI velocity.<sup>4</sup> Follow-up: Tailor to the patient and family motivation. Many experts recommend at least monthly follow-up visits. After 3–6 months, if the BMI/weight status has not improved consider advancing to Stage 2.
- Stage 2 Structured Weight Management**: Where/By Whom: Primary Care Office/Primary Care Provider. What: Follow-up themed visits (15-20 min) focusing on behaviors that resonate with the patient, family and provider. Consider partnering with dietician, social worker, athletic trainer or physical therapist for added support and counseling. Goals: Positive behavior change. Weight maintenance or a decrease in BMI velocity. Follow-up: Tailor to the patient and family motivation. Many experts recommend at least monthly follow-up visits. After 3–6 months, if the BMI/weight status has not improved consider advancing to Stage 3.
- Stage 3 Comprehensive Multi-disciplinary Intervention**: Where/By Whom: Pediatric Weight Management Center/Diabetes Medical Director/Team. What: Follow-up themed visits (15-20 min) focusing on behaviors that resonate with the patient, family and provider. Consider partnering with dietician, social worker, athletic trainer or physical therapist for added support and counseling. Goals: Positive behavior change. Weight maintenance or a decrease in BMI velocity. Follow-up: Tailor to the patient and family motivation. Many experts recommend at least monthly follow-up visits. After 3–6 months, if the BMI/weight status has not improved consider advancing to Stage 4.

**Stage 4 Tertiary Care Intervention**: Where/By Whom: Pediatric Weight Management Center/Diabetes Medical Director/Team. What: Follow-up themed visits (15-20 min) focusing on behaviors that resonate with the patient, family and provider. Consider partnering with dietician, social worker, athletic trainer or physical therapist for added support and counseling. Goals: Positive behavior change. Decrease in BMI velocity. Follow-up: Determine based upon patient motivation and medical needs.

51

**Management and Treatment Stages for Patients with Overweight or Obesity**

- Patients should start at the least intensive stage and advance through the stages based upon the response to treatment, age, BMI, health risks and motivation.
- An empathetic and empowering counseling style, such as motivational interviewing, should be employed to support patient and family behavior change.<sup>12</sup>
- Children age 2–5 who have obesity should not lose more than 1 pound/month; older children and adolescents with obesity should not lose more than an average of 2 pounds/week.

**Stage 1. Prevention Plus**

**Where/By Whom:** Primary Care Office/Primary Care Provider

Management and Treatment Stages for Patients with Overweight or Obesity	
• Patients should start at the lowest level and stage and advance through the stages based upon the response to treatment.	• As appropriate, increase intensity and complexity while still as motivational/motivating, should be employed to support behavior change.
• Children should not lose more than 1% of their weight per month.	• Children should not lose more than 1% of their weight per month, either alone or in addition to other interventions.
When/By Whom: Primary Care Physician/Treatment Team	What: Pharmacotherapy
When/By Whom: Primary Care Physician/Treatment Team	What: Pharmacotherapy
Grade: Recommendation	Grade: Recommendation
Follow-up: Up to 12 months post-treatment initiation or until resolution of change in BMI. Single follow-up visit to assess patient's response to treatment and to determine if further support is required. <p><b>Where/By Whom:</b> Pediatric Weight Management Center/Providers with expertise in treating childhood obesity</p> <p><b>What:</b> Recommended for children with BMI <math>\geq 25\%</math> and significant comorbidities if unsuccessful with Stages 1 - 3. Also recommended for children <math>&gt; 99\%</math> who have shown no improvement under Stage 3. Intensive diet and activity counseling with consideration of the use of medications and surgery.</p> <p><b>Goals:</b> Positive behavior change. Decrease in BMI.</p> <p><b>Follow-up:</b> Determine based upon patient's motivation and medical status.</p>	

## What can be done in a well-child visit?

- Assessment: Is the patient at risk for complications due to his/her weight status?
- Begin the conversation (tailored to family and risk)
- Set the stage
- Gauge patient and family interest in continuing the conversation
- Arrange for follow-up:
  - Are labs necessary?
  - Is a referral necessary?
  - Does the patient and family want to keep talking about what to do to get healthy?

40

---

---

---

---

---

---

---

---

---

---

### Take Home Messages

- Assessment is a critical piece of the puzzle
- This assessment is doable in the primary care setting
- Children who have a BMI  $\geq 85\%$  may be sick and may need:
  - Special consideration to determine if they are ill
  - Laboratory tests
  - Additional work-up for comorbidities as determined by positive signs and symptoms and family history
