Approach to the Genetic Diagnosis of Autism

Margaret Rieley, MD

November 2, 2013

EASTERN MAINE MEDICAL CENTER

Why Genetics?

- 1:2500 (1980s)
- 1:88 to 1:100 (current)
- >500% increase over the last 20 years
- Declared "epidemic"
- 4-5 times more prevalent in boys
- Present in all racial, ethnic, social groups
- High heritability
- MZ twins 60-90% concordance
- DZ twins 0-10% concordance

Why Genetics?

- Examine and evaluate patient and family members
- Determine etiology
- Definitive diagnosis helps patient acquire services
- Provide information on prognosis
- Screen and potentially prevent morbidity
- Counsel on recurrence risk
- Targeted therapies (metabolic disorders, FXS)
- Empower the family by knowledge of underlying cause

Evaluation Scheme (ACMG)

- Pre-evaluation
  - Accurate ASD diagnosis
  - Sensory screening: complete audiogram
  - Cognitive testing
  - EEG (if seizures suspected)
  - Verify newborn screening results
  - Prenatal history (GA, Wt, parental ages, exposures)
  - Karyotype
  - Fragile X (AAP recommendations)

Tier 1 - Physical Exam

- Evaluation for known syndromes or associated conditions
- Intellectual disability (ID) (75%)
- Dysmorphic features and epilepsy (25%)
- MRI and EEG abnormalities (less common)
- Microcephaly (10%)
- Macrocephaly (20–40%)
- Congenital anomaly (6% vs. 3% in gen pop)
  - Congenital anomalies double risk of autism (0.4% vs. 0.2% in gen pop)
  - Brain and eye more likely to be associated with autism
- Majority are *nondysmorphic with no other medical features suggestive of a syndrome*

1st Tier, continued

- Woods lamp exam
- Targeted testing if specific diagnosis is considered
  - Rubella titers
    - Rare (<10 cases/yr)
    - Sensorineural deafness (58%)
    - Eye abnormalities—retinopathy, cataract and microphthalmia (43%)
    - Congenital heart disease (50%)
  - "Standard" metabolic screening
    - clinical indicators present
    - suspected condition not screened for on NB screening
  - Urine mucopolysaccharides and organic acids
  - Serum lacate, amino acids, ammonia, acyl-carnitine profile, CK, LFTs.
- Chromosomes and fragile X (if not already performed)

Chromosome abnormalities

- 46,XY,t(5;16)(p13.2;p13.2)
- 46,XX,inv(2)(p11;2q13)
- 46,XY,t(5;17)(q33;p13)
- 46,XY,t(3;6)(q26.2;q16.2)
- 46,XY,t(3;5)(q26.2;q22)
- 46,XX,t(6;7)(q13;q11.2)
- 46,XY,t(6;9)(q16.2;q13)
- Duplication (13)(q14.1q21.3)
- 46,XY,del (6)(q16.1q21)

- 46,XY,dup(15)(q11q13)
- 46,XY,del(10)(q26.3).ish del(10) (q telomere)(D10S2490-)
- 47,XY,+idic(15)(q13)
- 47,XX,+21 (2)
- 46,XY,?ins(6)(?p23?q13?q21)
- 46,XY,inv(9)(p11q13)(2)
- 47,XXY

Pediatrics, 2010

Evaluation Scheme- 2nd Tier

- Fibroblast karyotype if clonal pigmentary abnormalities present
- Chromosomal microarray
- MECP2 gene testing (females)
- MECP2 duplication analysis (males)
- PTEN testing (HC >2 SD above mean)

Evaluation Scheme- 3rd Tier

- Brain MRI
- Serum and urine uric acid (inborn errors of purine and pyrimidine metabolism)
- Consider adenylosuccinase deficiency testing

Inborn Errors of Metabolism

- Up to 5% of ASDs
- PKU
- purine metabolism errors
  - adenylosuccinase deficiency
  - adenosine deaminase deficiency
- Creatine deficiency syndromes
- Smith-Lemli-Opitz syndrome
- Biotinidase deficiency
- Histidinemia

Most common etiologies

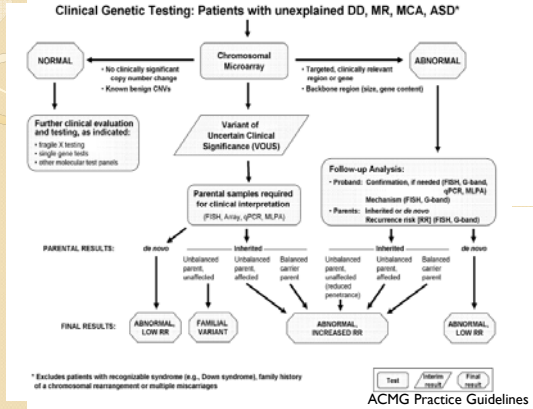
- Identifiable cause in 20-50% depending on study
- 5% high resolution chromosome abnormalities (2.2%)
- 5% Fragile X (0.5%)
- 5% Rett syndrome
- 3% PTEN mutations
- 10% other syndromes (Tuberous sclerosis, etc.)
- 10-20% microdeletion/duplication (18%)

Shen et al, Pediatrics, 2010

Test	Abnormal Result	(%)
Fragile X DNA, *n/N*	*2/852*	*(0.23)*
G-banded karyotype, *n/N*	*19/852*	*(2.2)*
Chromosomal microarray, *n/N*		
Variant (s) identified	204/848	(24.1)
Clinically significant	59/848	(7.0)
Deletions, *n/N (% of abnormal results)*	*37/59*	*(62.7)*
De novo, *n (% of deletions)*	*16*	*(43.2)*
Maternally inherited	5	(13.5)
Paternally inherited	2	(5.4)
Unknown	15	(40.5)
Duplications, *n/N (% of abnormal results)*	*22/59*	*(37.3)*
De novo, *n (% of abnormal duplications)*	*12*	*(54.5)*

Microarray

- AKA CGH arrays, CMAs, SNP arrays
- Detects gains and losses of DNA
  - deletions/duplications
  - Smaller than can be seen on karyotypes <5MB
- Hybridize patient's DNA with thousands of areas on chip
- Confirmed with FISH



ACMG Practice Guidelines

Microarray

- Uses
  - Congenital anomalies
  - Developmental delay
  - Autism
- Limitations
  - Balanced chromosomal rearrangements
  - Gene sequence alterations, single base pair changes
  - Genes and loci not included in chip
  - Mosaicism
  - Findings of unknown significance/parental samples not available

Array-CGH analysis: a test and a normal control DNA are labelled with different fluorochromes (in the figure, test is green, normal is red) and co-hybridised to a microarray containing DNA clones whose position in the human genome is known.

Pediatrics. 2010

Common array abnormalities

- 15q11q13 del or dup (maternal) 5%
  - candidate genes including UBE3A, GABRA5, and GABRB3
- 16p11.2 del or dup
- 17q12 del
- 22q13 del
- 22q11.2 del
  - incidence 1:2000
  - Social deficits can be misdiagnosed as autism (20-50%)
- 7q22-7q33 deletions
  - FOXP2 gene involved in language

Benign vs. Pathogenic CNVs

Primary Criteria	Pathogenic	Benign
CNV inherited from healthy parent		+
Expanded/altered CNV from parent	+	
Identical CNV inherited from affected parent	+	
Similar to CNV in relative		+
Similar to CNV in affected relative	+	
CNV contained within reported genomic imbalance in healthy individuals		+
CNV overlaps region of genomic imbalance assoc with ID/DD/Autism/MCA	+	
CNV overlaps genomic coordinates of known deletion/duplication syndrome	+	
CNV contains morbid OMIM genes	+	

Benign vs Pathogenic CNVs

Primary Criteria	Pathogenic	Benign
CNV is gene rich	+	
CNV is gene poor		+
CNV is a deletion	+	
CNV is a homozygous deletion	+	
CNV is a duplication (no known dosage sensitive genes)		+
CNV is a amplification (>1 copy gain)	+	
CNV is devoid of known regulatory elements		+

Syndromes associated with Autism

- Fragile X
- Rett syndrome
- Angelman syndrome
- Prader-Willi syndrome
- Smith-Lemli-Opitz
- Smith-Magenis syndrome
- Tuberous sclerosis
- PTEN (Cowden, Bannayan-Riley-Ruvalcaba syndrome)
- 22q11.2 deletions
- Sotos syndrome
- CHARGE syndrome
- Hypomelanosis of Ito
- Lujan-Fryns syndrome
- Corneila de Lange syndrome
- Fetal Alcohol syndrome

Autism evaluation recommended

- Apert syndrome
- Williams syndrome
- Joubert syndrome
- Down syndrome
- Noonan syndrome
- Turner syndrome
- Neurofibromatosis 1
- Myotonic dystrophy
- Duchenne muscular dystrophy
- Moebius syndrome
- Cohen syndrome
- Oculo-auriculo-vertebral spectrum

22q11.2DS Clinical Features

- Congenital heart disease (conotruncal) (74%)
- Palatal abnormalities (69%)
- Characteristic facial features
- Learning difficulties (70%-90%)
- Immune deficiency (77%)
- Hypocalcemia (50%)
- Significant feeding/swallowing problems
- Renal anomalies (31%)
- Hearing loss
- Laryngotracheoesophageal anomalies
- Growth hormone deficiency
- Seizures
- CNS
- Ophthalmologic abnormalities

Figure 1: Mild dysmorphic facial features of a woman with 22q11.2 deletion syndrome (left, aged 11 years; right, aged 25 years).

Kapadia R K , and Bassett A S CMAJ 2008;178:391-393

CMAJ·JAMC

22q11.2DS and Autism

- Reported in *Time* Magazine
- 29 children with 22q11.2DS
- ADOS, SCQ, BASC-2 PRS
- Previous data- 10-40% prevalence of ASD
- BASC-2 PRS
  - 4/5 with elevated ADOS showed elevated anxiety and/or somatization scores
- Abnormal SCQ scores 2/29
- Abnormal ADOS- 5/29
  - 1/5 of these was above autism cut off
  - 4/5 above ASD cut off, below Autism cut off
  - Strengths-social interaction
  - Weakness-imagination and insight
  - Elevated ADOS scores associated with communication weakness
- None had both elevated SCQ and ADOS scores

22q11.2 DS and Autism

- False elevations in ASD rates
  - Comorbid conditions
    - Anxiety, ADHD
    - Reciprocal social interaction, Communication, and Repetitive/Restricted Behavior/Interests
      - Developmental delay, conceptual immaturity, borderline cognitive abilities (FSIQ 75), reduced social competence
      - Concrete language/thinking characteristic of 22q11.2DS
      - Perseverative and repetitive behaviors
      - Limitations
        - Age range (7-14 yrs)
        - ABA may not be appropriate
          - Highly structured/repetitive
          - May lead to rigid and/or oppositional behaviors
          - ASD subgroup symptoms
            - ?higher risk of psychosis/schizophrenia

Single Gene Disorders

- Single-gene conditions(<20%)
- 10% or less
  - Tuberous sclerosis
  - Fragile X syndrome
    - 2-6% of autism caused by FXS
  - MECP2 Xq28
    - Deletions
    - Duplications (male)
      - Infantile hypotonia, severe to profound ID, autism or autistic features, poor speech development, recurrent infections, epilepsy, progressive spasticity, developmental regression (less common)
      - Most maternally inherited
        - mothers may have mild neuropsychiatric symptoms

Fragile X

- Full mutation expansions (>200 CGG repeats)
  - Generally silenced
  - Resulting in absence of the *FMR1* protein and fragile X syndrome.
- Smaller expansions in the premutation range (55-200 CGG repeats)
  - Resulting in *excess* gene activity and RNA toxicity
    - neurodegenerative disorder fragile X-associated tremor/ataxia syndrome (FXTAS)

Fragile X full mutation

Full mutation (>200 CGG repeats)
- 1 in 3600 males
- 1 in 2700 females

- Premutation (55-200 repeats)
  - 1 in 130-260 females
  - 1 in 300-800 males

Full Mutation (25-80% of children)	Premutation in Children (10-30% of children)	Premutation in Adulthood (20-25% of males, 4-8% of females)
ADHD	ADHD	Anxiety
Autism spectrum disorders	Autism spectrum disorders	Depression
Flat feet	Hyperextensible finger joints	POF
Hand biting	Prominent ears	FXTAS (30-35% of males,
Hand flapping	Shyness	- Tremor
High arched palate	Social Anxiety	- Ataxia
Hyperextensible finger joints		- Neuropathy
Long face		- Muscle pain
Macroorchidism		- Hypothyroidism
Mitral valve prolapse		- Cognitive decline
Mood instability		- Anxiety
Perseverative speech		- Depression
Poor eye contact		- Apathy
Prominent ears		- Dysinhibition
Shyness		
Social anxiety		
Tantrums		

Facial phenotype

med.miami.edu

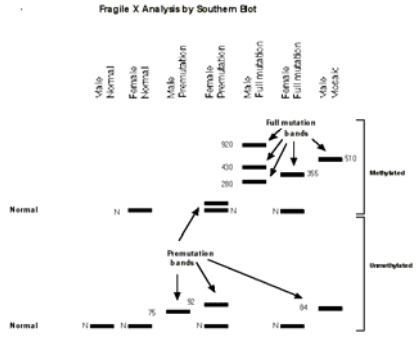
Fragile X and Autism

- 15-30% of patients also have autism
  - Autism as high as 30%
  - PDD as high as 20%
- More common in boys with FXS
- More severe ID in FXS plus autism

Fragile X testing

- Southern blot analysis test determines
  - full mutation
  - Approximate repeat size
  - whether the gene has been methylated
  - mosaicism of the gene
  - Used to confirm diagnosis after expanded repeats found by PCR
- Polymerase chain reaction (PCR) analysis determines
  - Actual number of CGG repeats
  - PCR has been not the test of choice to diagnose a full mutation
    - accurate in determining premutation and normal gene repeat numbers.
    - less expensive and quicker than Southern blot
    - Used to screen pregnant women
- Rare mutations unrelated to CGG repeats will be missed

Southern Blot



Fragile X- ?Future therapies

- Mavoglurant (AFQ056)
  - mGluR5 antagonist
  - Targets excessive mGluR in fragile X brain cells
  - Early studies show can correct some deficits (Doering, 2013)
  - Restores social behavior in FMR1 KO mice
  - Open clinical trial
- Minocycline
  - Decreases levels of matrix metalloproteinase-9 (MMP-9)
    - Synaptic transmission and plasticity
  - Clinical Global Impression Scale-Improvement
  - Improvement in anxiety and mood symptoms
  - No side effects (Leigh, 2013)

Autism Gene Sequencing

- Next generation sequencing
  - ADSL, AFF2, AP1S2, ARX, ATRX, BCKDK, BRAF, CACNA1C, CASK, CDKL5, CHD7, CNTNAP2, CREBBP, DHCR7, DMD, EHMT1, FGD1, FMR1, FOLR1, FOXG1, FOXP1, FOXP2, GABRB3, HPRT1, KDM5C, L1CAM, MBD5, MECP2, MED12, MEF2C, MID1, NHS, NIPBL, NLGN3, NLGN4X, NR1I3, NRXN1, NSD1, OPHN1, PAFAH1B1, PCDH19, PHF6, PNKP, PQBP1, PTCHD1, PTEN, PTPN11, RAB39B, RAI1, RELN, SCN1A, SLC2A1, SLC9A6, SMARCB1, SMC1A, TCF4, UBE2A, UBE3A, VPS13B, ZEB2
- Misses mutations in promoter region, deep intronic regions, or other regulatory elements, and does not detect large deletions.
- Whole exome sequencing
  - De novo mutations revealed by whole-exome sequencing are strongly associated with autism, (Sanders et al, Nature 2012)

Genetic Counseling

- Recurrence risk for ASD varies by gender for the second child to be affected
- 4% if the first child affected is female and
- 7% if a male
- 25–50% if the second child is also diagnosed with ASD

Pitfalls for primary care

- Genetic testing
  - What test to order/what lab to use
  - Who to test
  - Pretest counseling
  - Insurance coverage
  - Interpretation of results
  - Time limitations

Conclusions

- Consider a genetics evaluation for all children with autism
- Physical exam is important
- Testing
  - Chromosomes and fragile X
  - Microarray
  - Single gene disorders
- Consider MRI brain, EEG

J Dev Behav Pediatr. 2013 Apr;34(3):147-55. doi: 10.1097/DBP.0b013e318287cd17.A randomized double-blind, placebo-controlled trial of minocycline in children and adolescents with fragile x syndrome.Leigh MJ, Nguyen DV, Mu Y, Winarni TI, Schneider A, Chechi T, Polussa J, Doucet P, Tassone F, Rivera SM, Hessl D, Hagerman RJ.

Recent publications

- AFF2 gene
- Associated with Fragile XE/ FMR2
  - Different fragile site than FMR1
- Form of nonsyndromic ID
- Sequenced 202 male ASD probands and found that 2.5% of males sequenced had missense mutations at highly conserved evolutionary sites. (Mondal et all, 2012)

The Future: Whole Exome Sequencing

- De novo mutations revealed by whole-exome sequencing are strongly associated with autism, Sanders et al, Nature 2012

The Future: Autism Genome Project

- Launched 2004
- 50 research and academic centers, NIH, Autism Speaks, and Autism Genetic Resource Exchange (AGRE)
- Phase 1 – 1200 patient samples analyzed with CMA
- Phase 2 – study susceptibility genes with high throughput sequencing
- NRXN1, SHANK2, SYNGAP1, DLGAP2, PTCHD1 (x-linked) identified
